In 2021 CPC Inox together with Enel X developed a three-year decarbonization plan for the Basiano facility. After conducting an analysis on corporate circularity and climate-altering gas emissions, the company has started working on the installation of a photovoltaic system with more than 600 kW capacity for the Basiano plant. With 735,000 kWh produced and a self-consumption of almost 80%, it will allow to reduce the plant's energy consumption of the facility by more than 40%, granting a reduction in atmospheric emissions of 335 tons of CO<sub>2</sub> per year.
